How to install phpMyAdmin on the cPanel webhosting

phpMyAdmin only can be accessed from cPanel, but because of the many menus and logins, this can cause problems with usability. On the cPanel interface, you must create a subdomain name under one domain name.

- The subdomain name can be created on the cPanel interface under **Subdomains**. For example: phpmyadmin.domain_name.tld.
- The default main page layout for cPanel is the **Softaculous** installer at the bottom of the page. Click any of the icons in the **Categories** section.
- At the top right of the page that appears, type phpmyadmin in the search box, and then click phpMyAdmin in the search results that appear.
- At the top of the page, click **Install now**.
- From the second drop-down list, select the subdomain you created.
- Click the + sign next to **Advanced Options**.
- Select **Auto Upgrade**.
- Finally, click the **Install** button.

After installation, you can access phpMyAdmin from your browser. So you do not have to log in to the cPanel interface to access databases.
